

SwarmCoach

Your Personal AI Debate Team Powered by Swarm Intelligence

Tagline

Turn tough decisions into clear, consensus-driven action with a living swarm of specialized AI agents.

Product Overview

SwarmCoach is a freemium SaaS platform that uses swarm intelligence to help individuals and small teams make better decisions. Instead of a single AI giving one opinion, users get a dynamic swarm of 20–200+ specialized AI agents that debate, challenge assumptions, and converge on ranked recommendations — functioning like an always-available, super-intelligent advisory board.

Target Users

- Individuals: freelancers, founders, executives
- Small teams: startups and remote squads (2–15 people)

Primary Use Cases

Career moves, startup pivots, investments, hiring decisions, major purchases, strategic choices, and life decisions.

Key Features

- Instant “Decision Room” chat interface — paste or upload context and watch the swarm debate live
- Customizable agent roles: Optimist, Devil’s Advocate, Data Analyst, Risk Guru, Ethical Guardian, Future Self, etc.
- Real-time debate visualization with animated agent handoffs, votes, and convergence
- Final synthesized report: ranked options, confidence scores, counter-arguments, risks, and actionable next steps
- Persistent memory vault (Zep-powered) for long-term recall across decisions
- Team collaboration mode: invite members, assign roles, run async debates
- Voice input support and one-click exports (PDF, Notion, Email)
- Freemium model with clear Pro unlocks for larger swarms and unlimited runs

Methodology – Swarm Intelligence Core

SwarmCoach combines **classical swarm intelligence** principles (decentralized emergence, local interactions, stigmergy via shared memory) with modern LLM-powered agent orchestration.

- Agents use lightweight handoff rules inspired by Particle Swarm Optimization.
- No central planner — complex consensus emerges naturally from hundreds of micro-debates.
- Structured yet fully emergent: 3–5 debate rounds lead to natural convergence without top-down scripting.

This approach delivers more balanced and robust outcomes than single-model responses or simple sequential chains.

User Flow

1. User creates a new Decision Room and provides context (text, PDF, spreadsheet, etc.).
2. Swarm spins up (default 30 agents; Pro supports 200+).
3. Agents debate in parallel with live streaming updates.
4. Chief Synthesizer agent delivers the final executive summary.

Typical runtime: 30–90 seconds (small swarm) to 3–5 minutes (large swarm).

Technical Architecture

- **Frontend:** Next.js 15 (App Router) + Tailwind CSS + shadcn/ui + Vercel AI SDK (streaming + visualizations)
- **Backend:** FastAPI (Python)
- **Agent Engine:** OpenAI Swarm (lightweight handoffs) or CrewAI (richer task & memory features)
- **Memory & State:** Zep Cloud + LangGraph checkpoints
- **LLM Layer:** LiteLLM proxy (supports Groq, Anthropic, OpenAI with cost-optimized routing)
- **Database:** Supabase Postgres (with row-level security) + Supabase Storage
- **Deployment:** Vercel (frontend) + Railway (backend)
- **Local Development:** Full Docker Compose setup (inspired by MiroFish structure)
- **Security:** End-to-end data encryption and audit-ready logs

Pricing & Monetization

- **Free:** 5 decisions/month, max 30 agents
- **Pro:** \$19/month (unlimited decisions, 200 agents, custom roles, team invites)
- **Team:** \$49/month for 5 seats
- Annual discounts + usage-based overages for very large swarms

Go-to-Market: Ideal for fast traction via Product Hunt, Reddit, X, and indie hacker communities.

Differentiation

Purpose-built for personal and team decisions with beautiful real-time debate UX and true emergent consensus – distinctly different from massive prediction engines (like MiroFish) or generic agent frameworks.
